Activity matching | Same matched sample for both vocabularies

HISTORICAL SAMPLE | Source population unverified; no population-wide inference

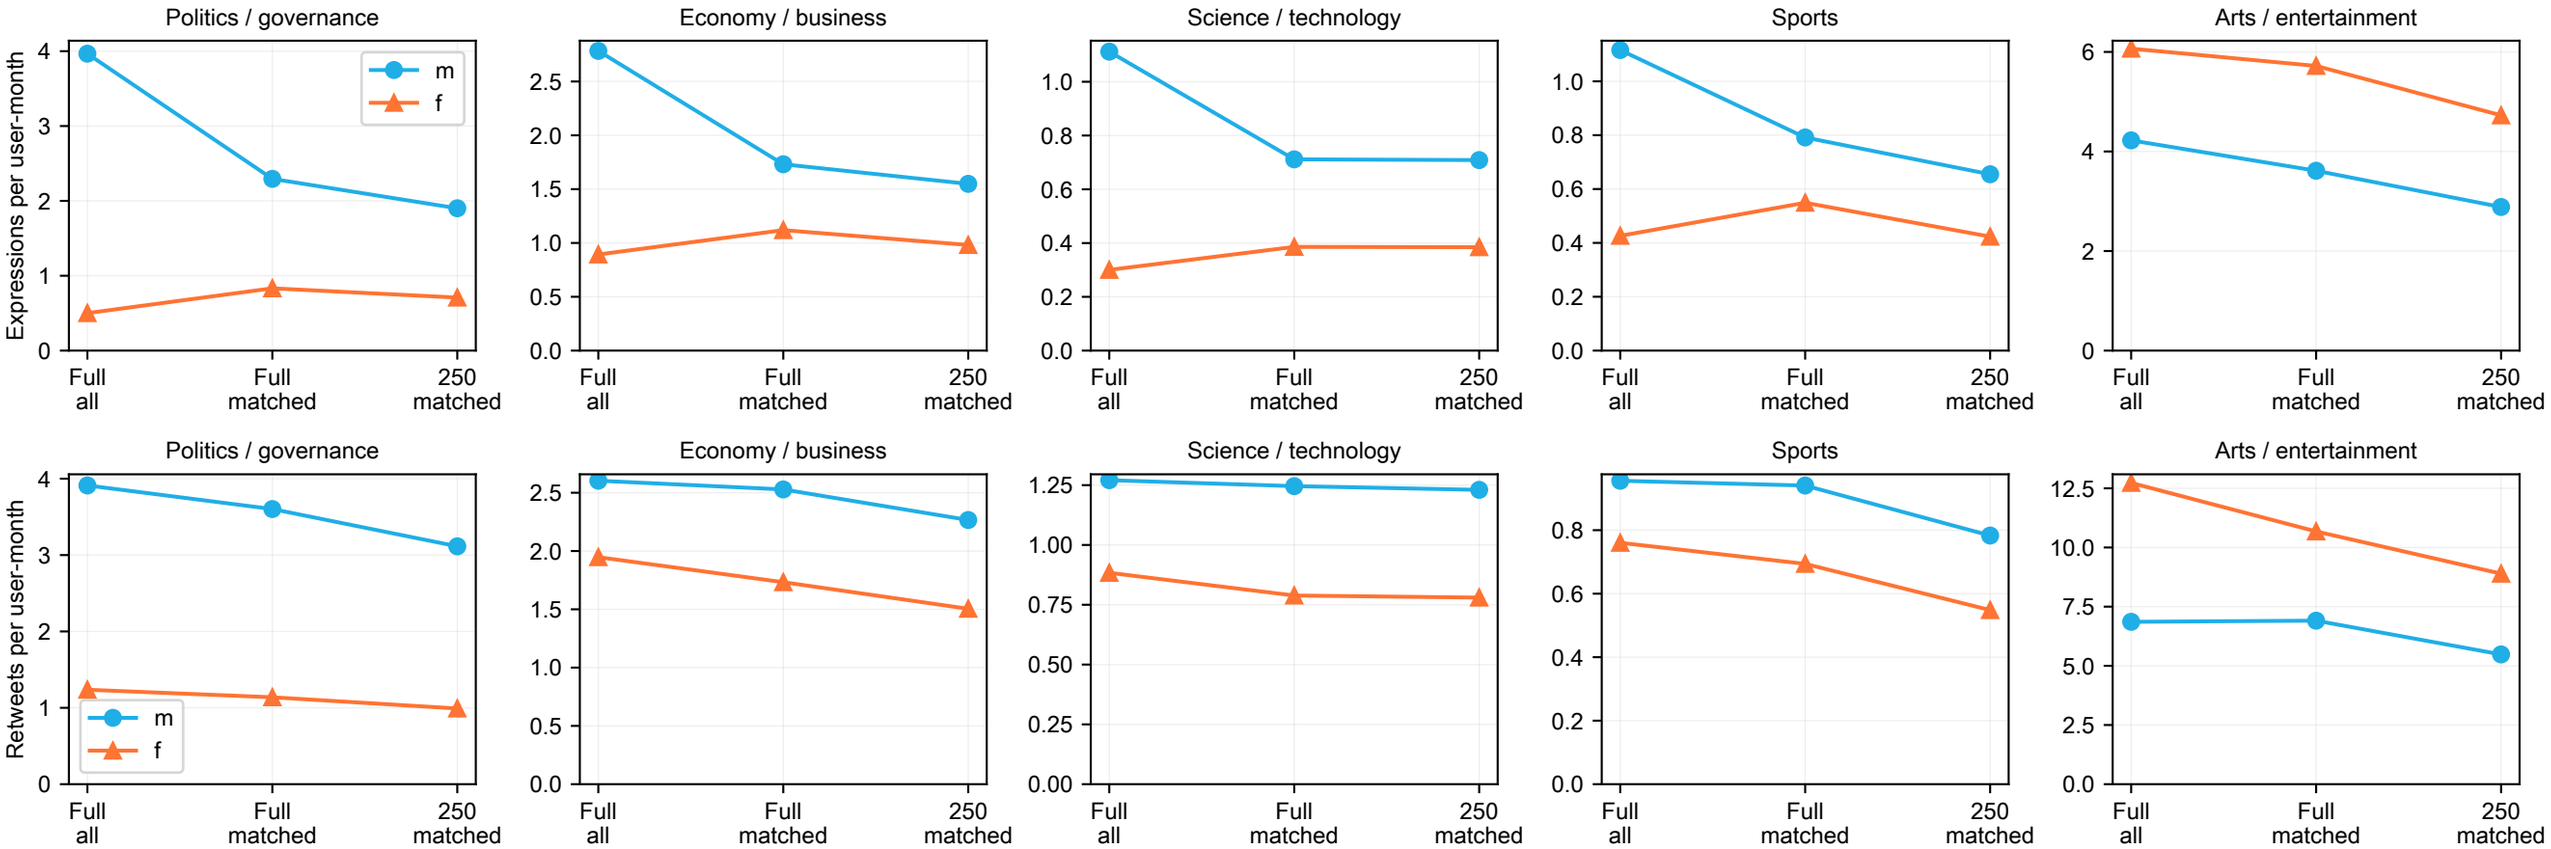

1:1 coarsened exact matching on three log1p activity measures. Shaded bars: original sample.

Monthly frequency | Activity matching and equal-size vocabulary

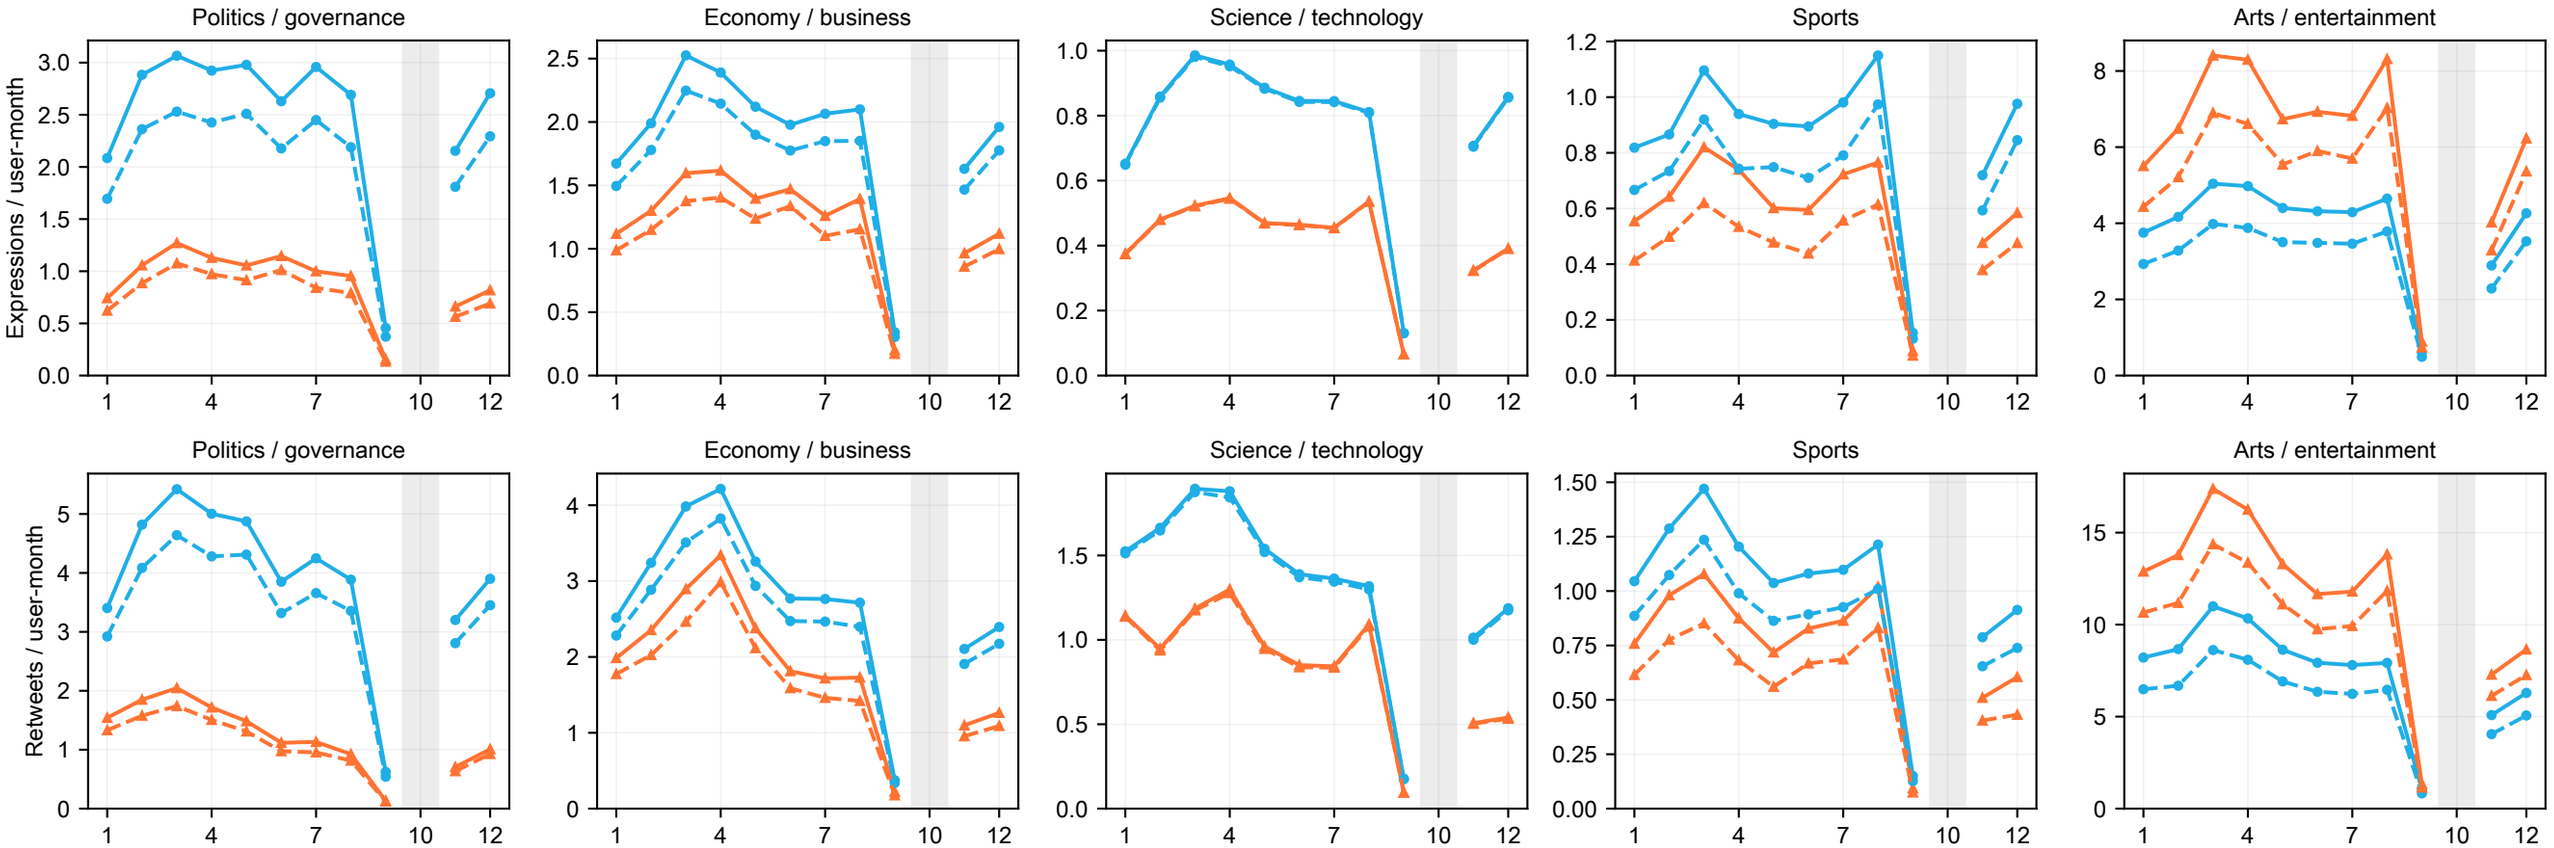

HISTORICAL SAMPLE | Source population unverified; no population-wide inference

Observed annual count / 12 for each user; zero counts retained. Points are means, not confidence intervals.

Monthly trajectories | Matched users

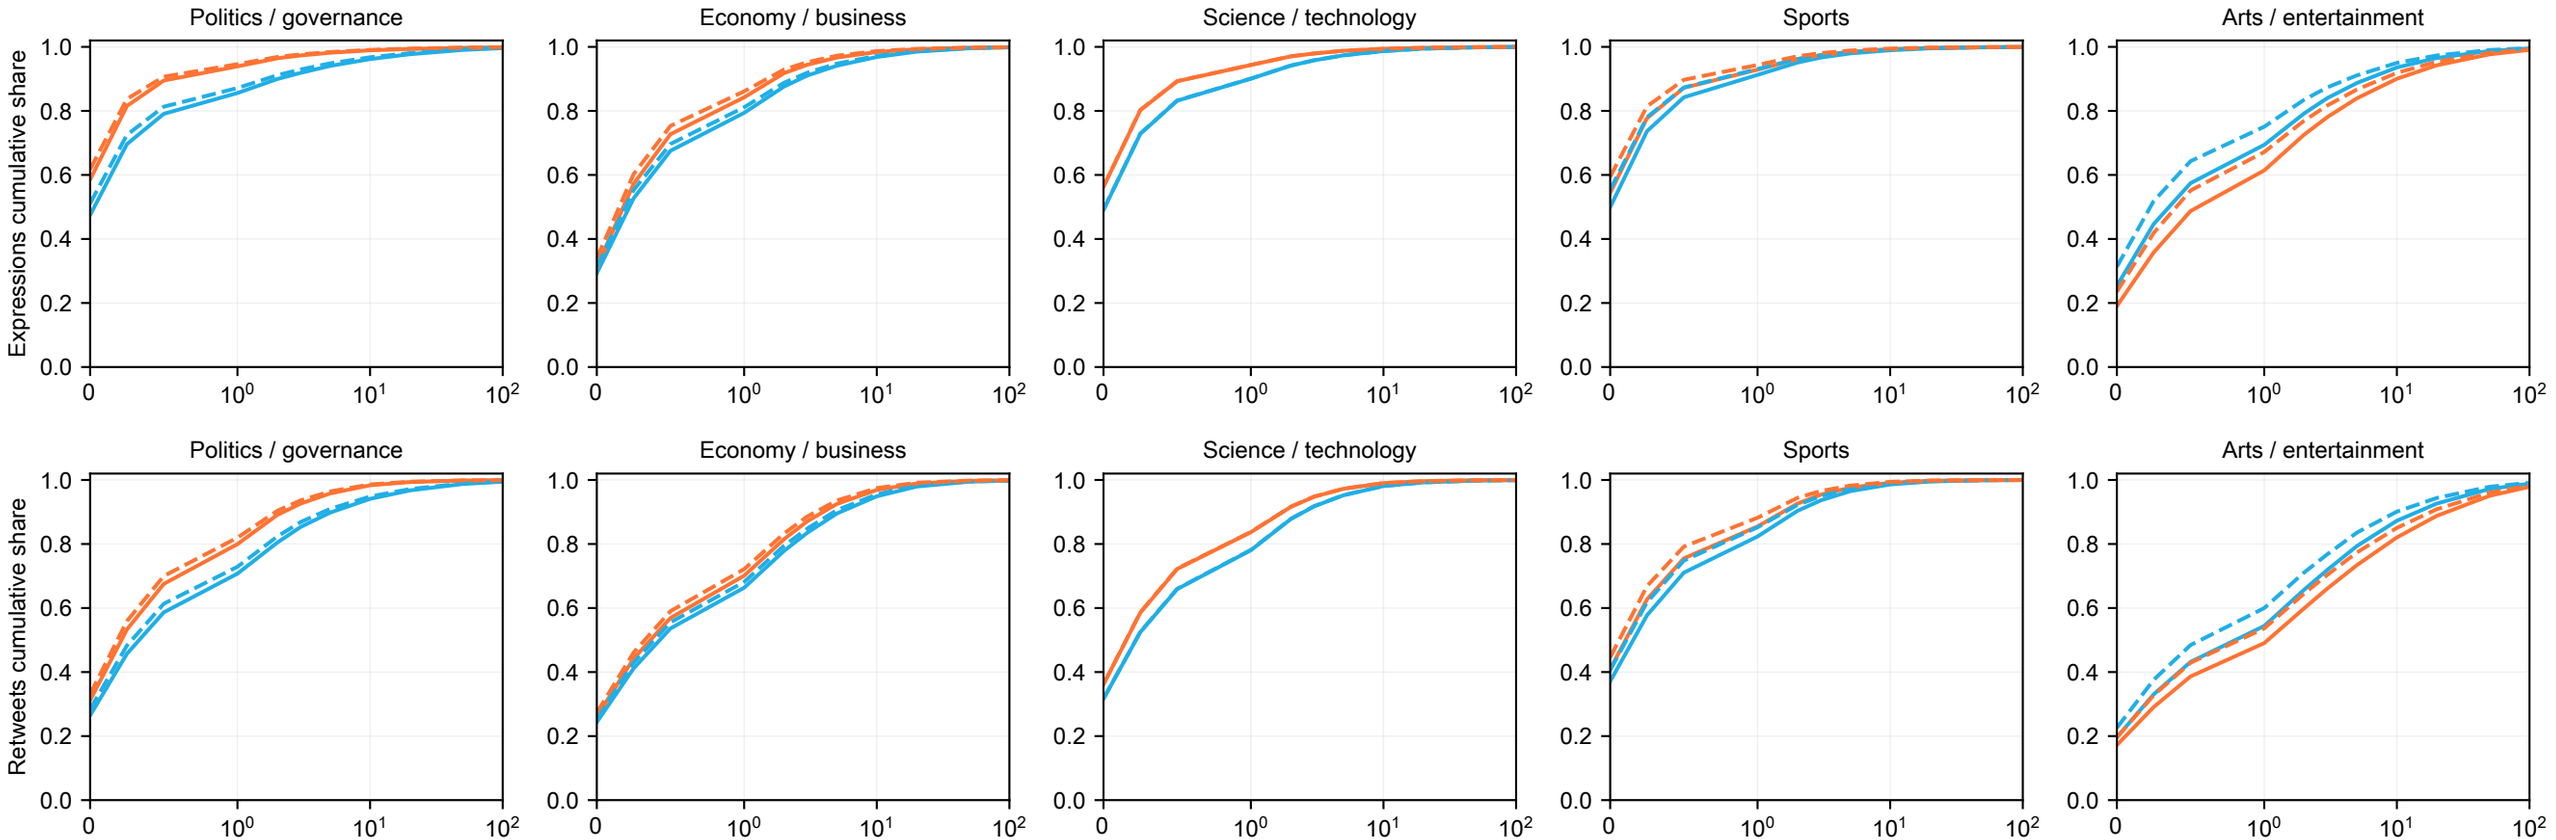

HISTORICAL SAMPLE | Source population unverified; no population-wide inference

Blue circles: male; orange triangles: female. Solid: full; dashed: 250. October has no source files (gap); June, September and November have partial coverage.

Frequency distributions | Annual mean monthly frequency per user

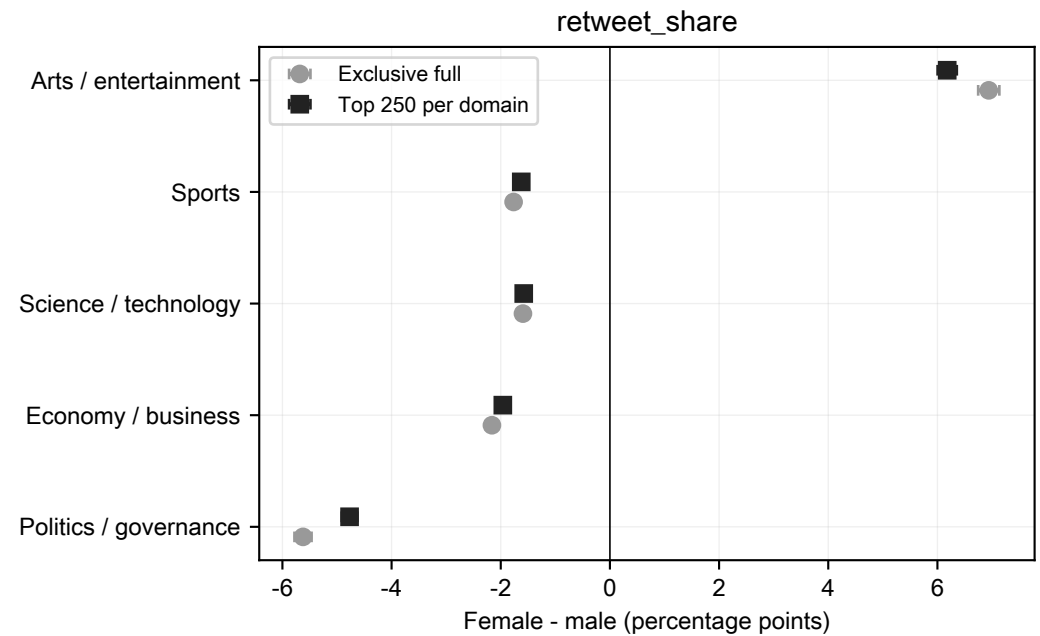

HISTORICAL SAMPLE | Source population unverified; no population-wide inference

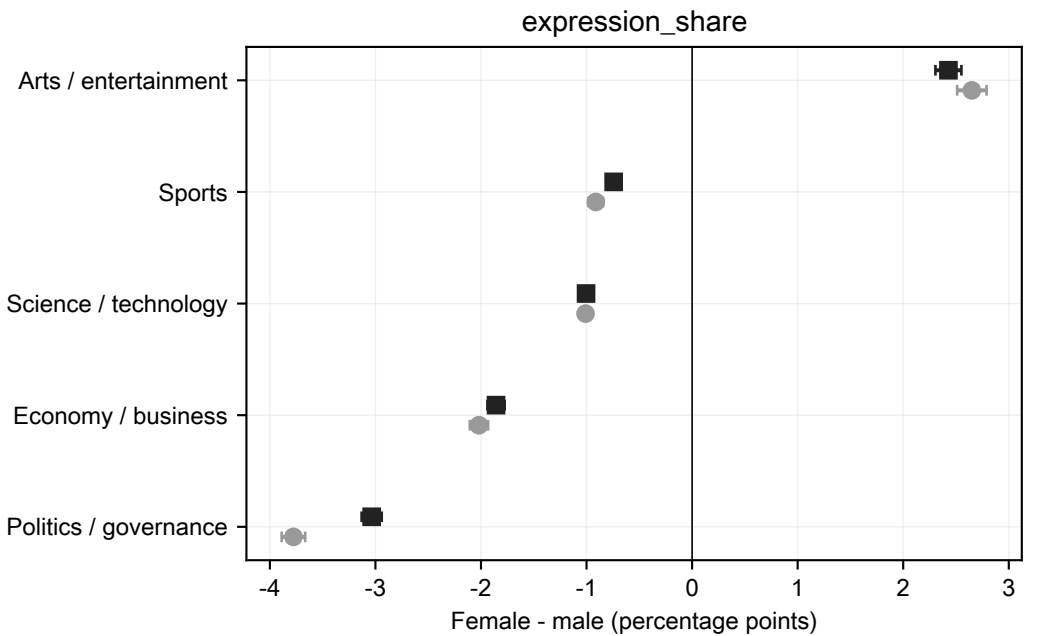

CDF at histogram upper bounds (strictly below bound). Solid: full; dashed: 250. Tail above 100 not shown.

Participation shares | Full-sample activity-adjusted OLS

HISTORICAL SAMPLE | Source population unverified; no population-wide inference

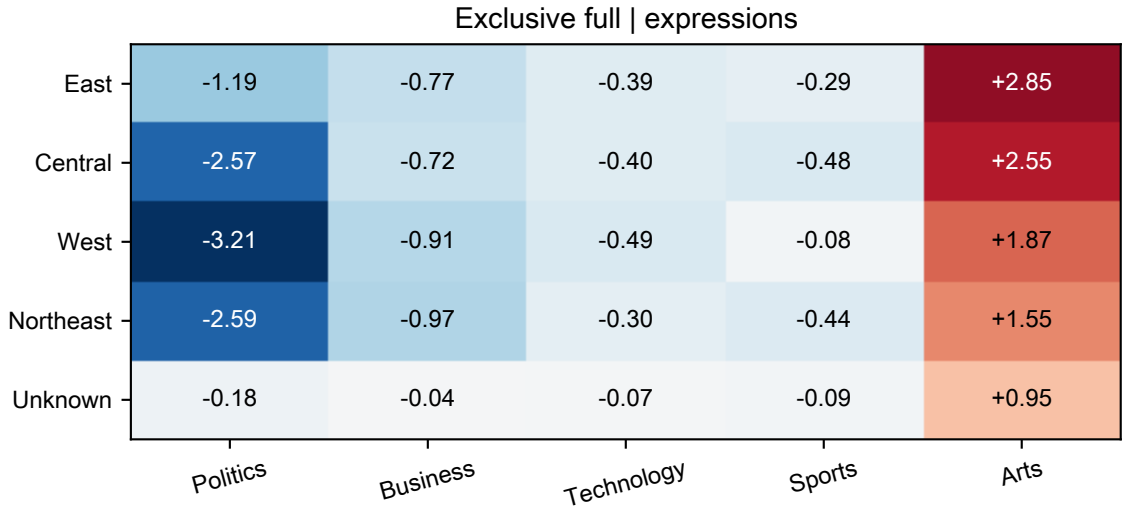

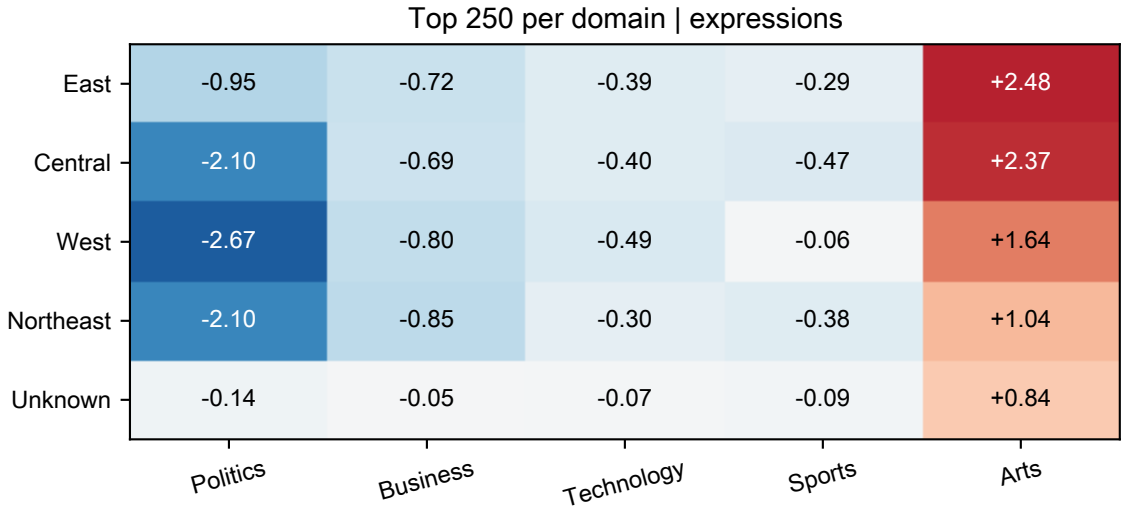

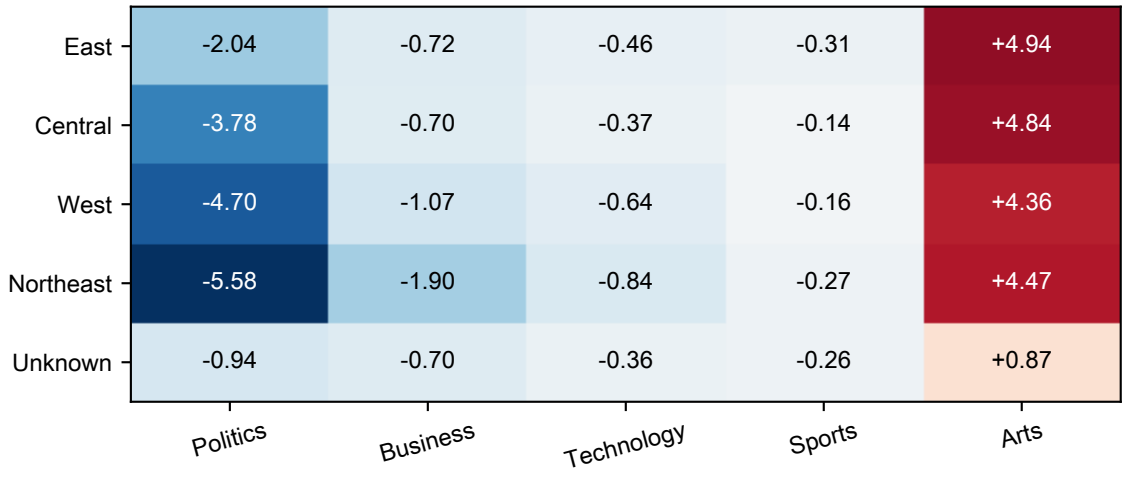

95% HC1 intervals from server estimates. These are full-sample regressions, separate from matching.

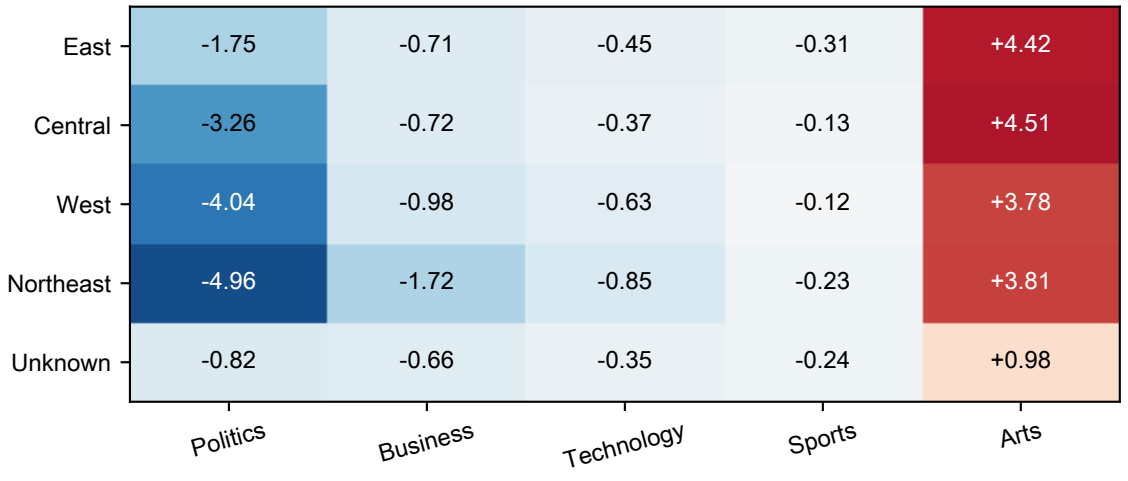

Region differences | Female - male monthly frequency, matched sample

HISTORICAL SAMPLE | Source population unverified; no population-wide inference

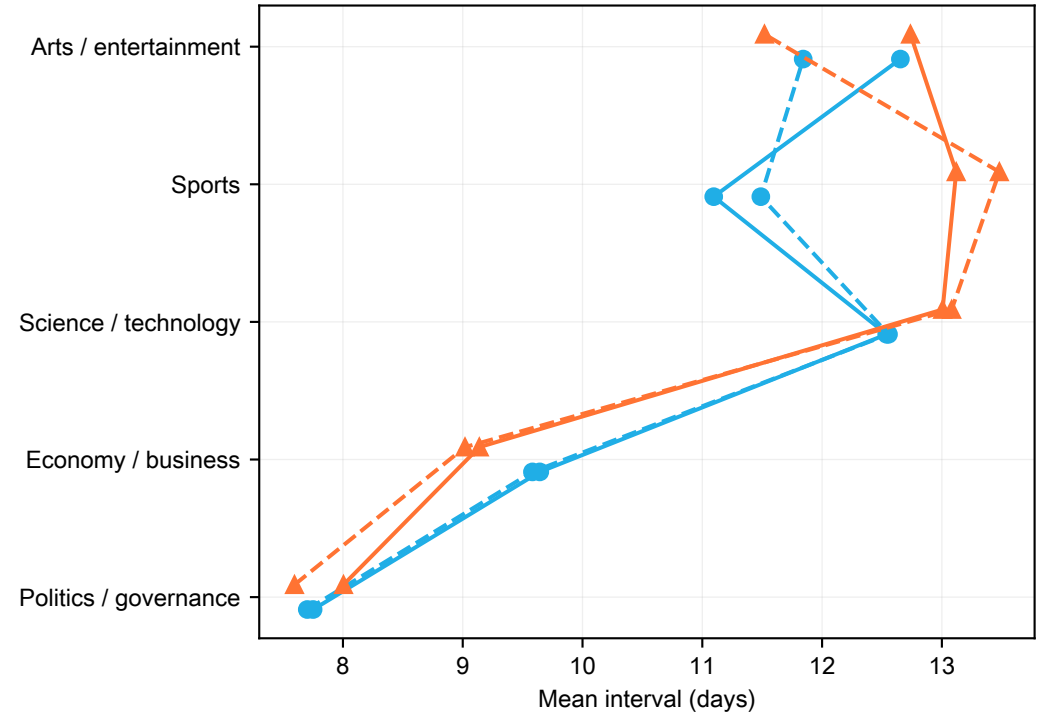

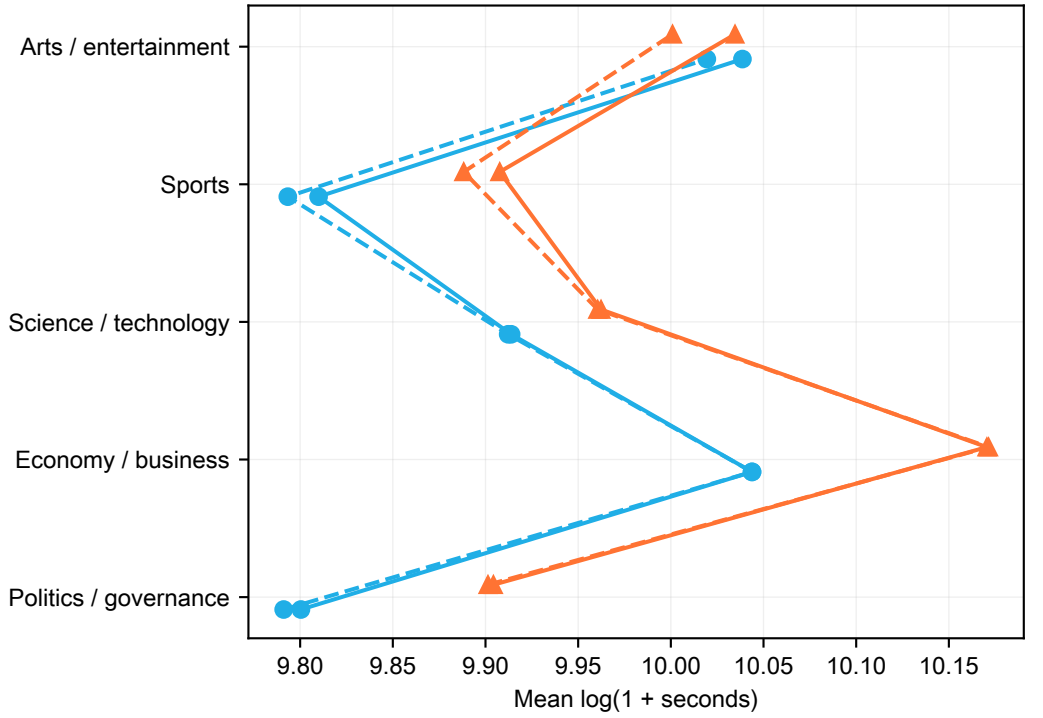

Shared color scale within each metric. Region Unknown is retained; region differences are descriptive.

Repost intervals | User-weighted annual means, matched sample

HISTORICAL SAMPLE | Source population unverified; no population-wide inference

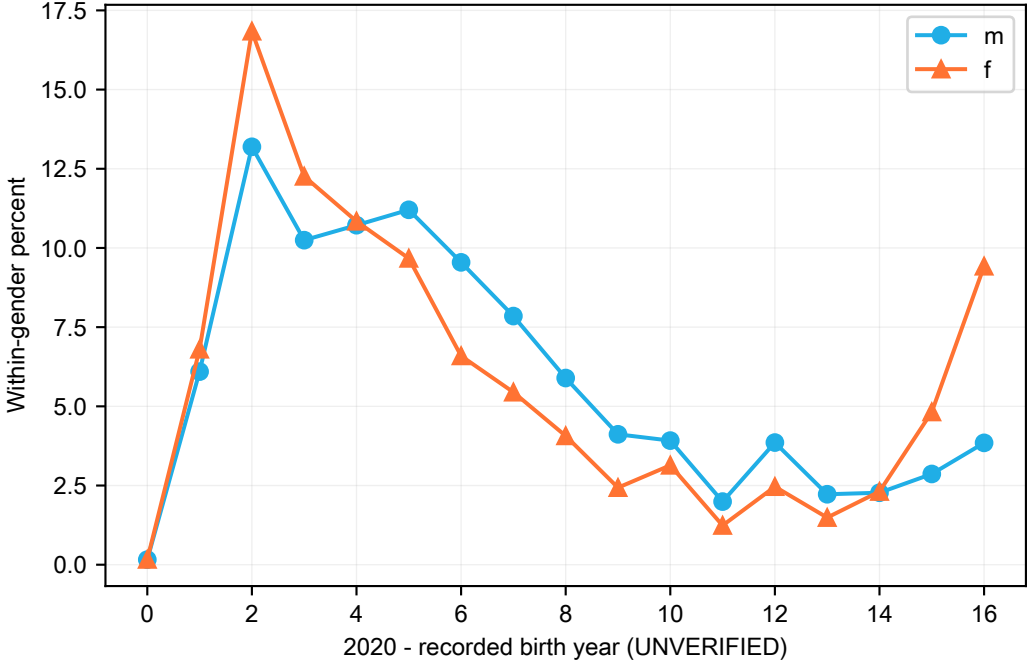

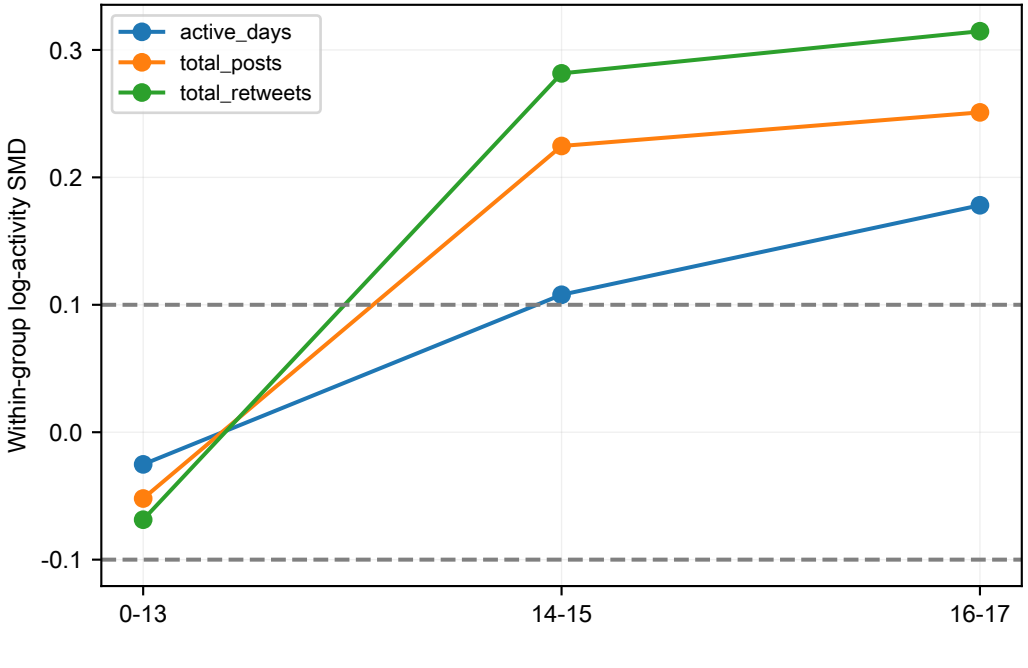

Solid: full; dashed: 250. Arithmetic means and mean log intervals reveal different parts of a long-tailed distribution.

Age diagnostics | Sample provenance unresolved

HISTORICAL SAMPLE | Source population unverified; no population-wide inference

All 225,339 users have recorded ages 0-16. Verify upstream selection and birthday semantics before generalizing any result.
